Quantstamp Security Assessment Certificate

KLAP

This audit report was prepared by Quantstamp, the leader in blockchain security.

Executive Summary

Type	Ethereum
Auditors	Ed Zulkoski, Senior Security Engineer Bohan Zhang, Auditing Engineer Andy Lin, Senior Auditing Engineer
Timeline	2022-06-13 through 2022-06-29
EVM	Arrow Glacier
Languages	Solidity
Methods	Architecture Review, Unit Testing, Functional Testing, Computer-Aided Verification, Manual Review
Specification	None
Documentation Quality	Medium
Test Quality	Low
Diff/Fork information	This code was based on the Geist protocol which is a fork from the Aave V2 repository at commit 61c2273.

Source Code

Repository	Commit
lending-contracts (initial report)	603b93a
lending-contracts (revised report)	9959ae2

Total Issues	8	(4 Resolved)
High Risk Issues	0	(0 Resolved)
Medium Risk Issues	1	(1 Resolved)
Low Risk Issues	5	(3 Resolved)
Informational Risk Issues	2	(0 Resolved)
Undetermined Risk Issues	0	(0 Resolved)

0 Unresolved
4 Acknowledged
4 Resolved

⌃ High Risk	The issue puts a large number of users' sensitive information at risk, or is reasonably likely to lead to catastrophic impact for client's reputation or serious financial implications for client and users.
⌃ Medium Risk	The issue puts a subset of users' sensitive information at risk, would be detrimental for the client's reputation if exploited, or is reasonably likely to lead to moderate financial impact.
⌄ Low Risk	The risk is relatively small and could not be exploited on a recurring basis, or is a risk that the client has indicated is low-impact in view of the client's business circumstances.
○ Informational	The issue does not post an immediate risk, but is relevant to security best practices or Defence in Depth.
? Undetermined	The impact of the issue is uncertain.

○ Unresolved	Acknowledged the existence of the risk, and decided to accept it without engaging in special efforts to control it.
○ Acknowledged	The issue remains in the code but is a result of an intentional business or design decision. As such, it is supposed to be addressed outside the programmatic means, such as: 1) comments, documentation, README, FAQ; 2) business processes; 3) analyses showing that the issue shall have no negative consequences in practice (e.g., gas analysis, deployment settings).
○ Fixed	Adjusted program implementation, requirements or constraints to eliminate the risk.
○ Mitigated	Implemented actions to minimize the impact or likelihood of the risk.

Summary of Findings

During the audit, we have reviewed changes to the core protocol when compared to related Aave V2 and Geist implementations. In total, 9 primary issues have been noted ranging from Medium to Informational severity. These primarily relate to changes from the existing codebase that are either inconsistent or incomplete (i.e., additional modifications may be necessary). We recommend addressing all issues before deploying the code in production. Additionally, the test scripts corresponding to the existing test suite (i.e., for directories others than `staking` and `venomics`) have not been updated. We strongly recommend ensuring that existing tests pass and the code changes do not break existing functionality.

Update: All issues have been fixed or acknowledged as of commit `9959ae2`.

ID	Description	Severity	Status
QSP-1	Inconsistent parameter semantics in `handleAction()`	^ Medium	Fixed
QSP-2	Incorrect pool used	⌄ Low	Fixed
QSP-3	Unmodified events	⌄ Low	Fixed
QSP-4	Not Handling All Token Types in `UiIncentiveDataProviderV2`	⌄ Low	Fixed
QSP-5	Missing or Hardcoding Incentive Value in `UiIncentiveDataProviderV2`	⌄ Low	Acknowledged
QSP-6	Outdated Dependency Interface and Functions	⌄ Low	Acknowledged
QSP-7	Clone-and-Own	O Informational	Acknowledged
QSP-8	Undocumented Interface	O Informational	Acknowledged

Quantstamp Audit Breakdown

Quantstamp's objective was to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices.

DISCLAIMER:
This report pertains to the diff from Aave V2 61c2273, but does not consider the `staking/*`, `venomics/*`, `PriceFeed.sol`, and `Timelock.sol`.

Possible issues we looked for included (but are not limited to):

- Transaction-ordering dependence
- Timestamp dependence
- Mishandled exceptions and call stack limits
- Unsafe external calls
- Integer overflow / underflow
- Number rounding errors
- Reentrancy and cross-function vulnerabilities
- Denial of service / logical oversights
- Access control
- Centralization of power
- Business logic contradicting the specification
- Code clones, functionality duplication
- Gas usage
- Arbitrary token minting

Methodology

The Quantstamp auditing process follows a routine series of steps:

1. Code review that includes the following
   i. Review of the specifications, sources, and instructions provided to Quantstamp to make sure we understand the size, scope, and functionality of the smart contract.
   ii. Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
   iii. Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to Quantstamp describe.

2. Testing and automated analysis that includes the following:
   i. Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
   ii. Symbolic execution, which is analyzing a program to determine what inputs cause each part of a program to execute.

3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.

4. Specific, itemized, and actionable recommendations to help you take steps to secure your smart contracts.

Toolset

The notes below outline the setup and steps performed in the process of this audit.

Setup

Tool Setup:

- Slither v0.8.3

Steps taken to run the tools:

1. Install the Slither tool: `pip3 install slither-analyzer`

2. Run Slither from the project directory: `slither .`

Findings

QSP-1 Inconsistent parameter semantics in `handleAction()`

Severity: *Medium Risk*

Status: Fixed

File(s) affected: `IncentivizedERC20.sol, IChefIncentivesController.sol, IAaveIncentivesController.sol`

Description: In `IncentivizedERC20._transfer()`, we have the following call to `handleAction()`: `_getIncentivesController().handleAction(sender, senderBalance, currentTotalSupply)`.
This differs from the original implementation in several ways:

1. The order of arguments `senderBalance, currentTotalSupply` are reversed (however this now correctly aligns with the order of parameters in `IChefIncentivesController.sol`).

2. `senderBalance` is now used instead of `oldSenderBalance` (which corresponded to the balance before the transfer occurred).

The other `IncentivizedERC20` functions `_mint()` and `_burn()` are updated similarly.
However, `StableDebtToken` implements its own version of the functions `_mint()` and `_burn()` that has calls to `handleAction()` of the form: `_incentivesController.handleAction(account, oldAccountBalance, oldTotalSupply)`. This swaps the order of arguments as noted above in point 1, but it still uses the old balance values in contrast to point 2.
It is not clear which approach aligns with the new `ChefIncentivesController`.

Recommendation: Add documentation `IChefIncentivesController.handleAction()` clarifying if `userBalance` should be calculated before or after the transfer (similarly for other actions such as `mint`). Ensure that `ChefIncentivesController` aligns with the new semantics.

Update: The code has been revised to use the "after" values throughout.

QSP-2 Incorrect pool used

Severity: *Low Risk*

Status: Fixed

File(s) affected: `protocol/lendingpool/LendingPoolConfigurator.sol`

Description: In `_initReserve()` on L89 and L124, the `pool` variable is used instead of `_pool`. This does not align with the other `_initTokenWithProxy()`, as in on L72.

QSP-3 Unmodified events

Severity: *Low Risk*

Status: Fixed

File(s) affected: `protocol/tokenization/AToken.sol`

Description: Although the `mintToTreasury()` function has been updated to mint tokens for both the `treasury` and `treasury.dev()` address, the `Transfer` and `Mint` events on L191-192 have not been updated.

Recommendation: Update the function to account for both mint and transfer operations.

QSP-4 Not Handling All Token Types in `UiIncentiveDataProviderV2`

Severity: *Low Risk*

Status: Fixed

File(s) affected: `misc/UiIncentiveDataProviderV2.sol`

Description: The function `getReserveIncentiveData()` sets the `IncentiveData` for `aIncentiveData` and `sIncentiveData` but misses the `vIncentiveData`. On the other hand, the function `_getReservesIncentivesData` sets the `IncentiveData` for `aIncentiveData` and `vIncentiveData` but comments out the code for `sIncentiveData`.

Exploit Scenario: The off-chain component will fail to read the incentive data correctly.

Recommendation: Please fixes the code to handle the incentive for all token types. However, from the code in `LendingPoolConfigurator.sol:_initReserve`, only "A Token" and "V Token" is used for the incentive. The team can remove incentive data regarding "S Token" if no longer used.
Also, please remove the commented code in `L154-180` and `L204-244` if not needed.

QSP-5 Missing or Hardcoding Incentive Value in `UiIncentiveDataProviderV2`

Severity: *Low Risk*

Status: Acknowledged

File(s) affected: `misc/UiIncentiveDataProviderV2.sol, misc/interfaces/IUiIncentiveDataProviderV2.sol`

Description: The struct of `IUiIncentiveDataProviderV2.sol:IncentiveData` includes 9 fields. However, the implementation in `UiIncentiveDataProviderV2.sol` hardcodes `emissionEndTimestamp` to 11111 and `precision` to 18. Also, `tokenincentivesUserIndex` is not being set for the struct `IUiIncentiveDataProviderV2.sol:UserIncentiveData`. Following are the places that might have issues in the file `UiIncentiveDataProviderV2.sol`:

- `getReserveIncentiveData`: in L68 and L95, the `emissionEndTimestamp` field is hardcoded as 11111. Also, L73 and L100 hardcodes the `precision` to 18.

- `_getReservesIncentivesData`: in `L140` and `L196`, the `emissionEndTimestamp` field is hardcoded as `11111`. Also, `L145` and `L201` hardcodes the `precision` to `18`.

- `getUserReservesIncentivesDataSingle`: `L288-291`, `L312-315`, and `L336-339` comment out the part setting `tokenincentivesUserIndex` to the `UserIncentiveData` struct

- `_getUserReservesIncentivesData`: `L381-384`, `L408-411`, and `L435-438` comment out the part setting `tokenincentivesUserIndex` to the `UserIncentiveData` struct

Exploit Scenario: The off-chain component will fail to read the incentive data correctly.

Recommendation: Please clarify if those fields are needed. If the new incentive controller no longer uses or provides the data for the fields, we recommend removing those fields from the struct to keep the code clean. Otherwise, please fill in the correct value for the fields.

Update: The team is going to keep this to reduce the change toward front-end. Also, the team can deploy new version in the future to fix this as this is only impacting the front-end system and not affecting the core protocol.

QSP-6 Outdated Dependency Interface and Functions

Severity: *Low Risk*

Status: Acknowledged

File(s) affected: `misc/AaveOracle.sol`

Description: The interface `IChainlinkAggregator` is outdated. Chainlink documentation ([link](#)) recommends using `AggregatorV3Interface`. Also, the function of the interface `latestAnswer` is deprecated ([link](#)).

Recommendation: Use the new interface and the recommended function.

Update: The team plans to operate with a custom oracle based off the older `IChainlinkAggregator`.

QSP-7 Clone-and-Own

Severity: *Informational*

Status: Acknowledged

File(s) affected: `dependencies/*/*.sol`

Description: The clone-and-own approach involves copying and adjusting open source code at one's own discretion. From the development perspective, it is initially beneficial as it reduces the amount of effort. However, from the security perspective, it involves some risks as the code may not follow the best practices, may contain a security vulnerability, or may include intentionally or unintentionally modified upstream libraries.

Recommendation: Rather than the clone-and-own approach, a good industry practice is to use a package manager (e.g., npm) for handling library dependencies. This eliminates the clone-and-own risks yet allows for following best practices, such as, using libraries. If the file is cloned anyway, a comment including the repository, commit hash of the version cloned, and the summary of modifications (if any) should be added. This helps to improve traceability of the file.

Update: The team prefers to keep the code base similar to the Aave one.

QSP-8 Undocumented Interface

Severity: *Informational*

Status: Acknowledged

File(s) affected: `IChefIncentivesController.sol`, `LendingPoolConfigurator.sol`

Description: The interface `IChefIncentivesController` has several function signatures that are not documented, making the usage in `LendingPoolConfigurator` unclear. For example, the function `addPool(address _token, uint256 i)` is called several times in `LendingPoolConfigurator._initReserve()` with `i = 1`. It is unclear if this is correct.

Recommendation: Add documentation to `IChefIncentivesController.sol`. Note that this issue exists for all new interfaces including `IMasterChef.sol`, `IPriceFeed.sol`, `IVe.sol`, etc.

Update: The team plans to add more interface document once they are ready to start the audit of the tokenomics.

Automated Analyses

Slither

Issues reported by slither have been identified as either false positives, or have been included as part of other issues noted above.

Adherence to Specification

No documentation was provided aside from AAVE ones.

Code Documentation

1. In `protocol/lendingpool/LendingPoolConfigurator.sol:L99`: consider renaming the comment `// GEIST does not...` -> `// Klap does not...`.

2. In `ILendingPoolConfigurator.sol`, the struct `InitReserveInput` has a new field `allocPoint`. It is not clear what this field is intended for as there is no inline documentation.

Adherence to Best Practices

1. In `protocols/libraries/math/MathUtils.sol`, `sqrt()` does not use SafeMath. Consider using SafeMath for operations as in L21 if numbers that could potentially overflow will be used.

2. Add unit tests for the `protocol/libraries/math/MathUtils.sol:sqrt`.

3. Use 2 spaces for the space indentation in `protocol/libraries/math/MathUtils.sol:sqrt` to make it consistent with the other part of the code.

4. Consider removing the `IAaveIncentivesController` as the team is migrating it to `IChefIncentivesController`. However, there are still two places (listed in the following) referencing the `IAaveIncentivesController` interface. Please clarify whether they are still needed and either remove the not-used contracts or migrate them to use `IChefIncentivesController`:

    - `misc/UiPoolDataProvider.sol`

    - `misc/interface/IUiPoolDataProvider.sol`

5. Remove the non-referenced clone-and-own dependencies:

    - `dependencies/openzeppelin/upgradeability/AddressUpgradeable.sol`: note that this is an empty file.

    - `dependencies/openzeppelin/upgradeability/ContextUpgradeable.sol`: this is only referenced in the `dependencies/openzeppelin/upgradeability/OwnableUpgradeable.sol`; but the `OwnableUpgradeable.sol` is not referenced in other places.

    - `dependencies/openzeppelin/upgradeability/OwnableUpgradeable.sol`: some code uses `OwnableUpgradeable.sol` from the `@openzeppelin` package instead of this clone-and-own folder.

    - `dependencies/openzeppelin/upgradeability/ReentrancyGuardUpgradeable.sol`: some code uses `ReentrancyGuardUpgradeable` from the from the `@openzeppelin` package instead of this clone-and-own folder.

6. Consider removing non-using contracts and interfaces:

    - `misc/Timelock.sol`

    - `misc/interfaces/IUiIncentiveDataProviderV3.sol`

    - `interfaces/IBondDepository.sol`: aside from not being used, should the naming be `IBand...` instead?

    - `interfaces/IUniswapExchange.sol`

7. Change the visibility of `misc/Timelock.sol:getBlockTimestamp` function from `internal` to `private`.

8. Remove unused local variable `prevChainlinkResponse` in `misc/PriceFeed.sol:L97`.

9. Remove the visibility statement of the `constructor`. Solidity 0.7 removes the need for explicit statement ([doc](#)):

    - `adapters/FlashLiquidationAdapter.sol`

    - `adapters/ParaSwapLiquiditySwapAdapter.sol`

    - `adapters/UniswapLiquiditySwapAdapter.sol`

    - `adapters/UniswapRepayAdapter.sol`

    - `misc/AaveOracle.sol`

    - `misc/UiPoolDataProviderV2.sol`

    - `misc/UiPoolDataProviderV2V3.sol`

10. Make the `protocol/lendingpool/LendingPoolStorage.sol` an `abstract` contract as it will not be used as a standalone contract.

11. Could replace the following code in `mintToTreasury()` from

```
contracts/protocol/tokenization/StableDebtToken.sol`
    _mint(
      treasury,
      amount
        .percentMul(PercentageMath.PERCENTAGE_FACTOR.sub(ITreasury(treasury).devPercent()))
        .rayDiv(index)
    );
    _mint(
      ITreasury(treasury).dev(),
      amount.percentMul(ITreasury(treasury).devPercent()).rayDiv(index)
    );
```

by

```
    uint256 rayDivRes = amount.rayDiv(index);
    uint256 shareForTreasury = rayDivRes.percentMul(PercentageMath.PERCENTAGE_FACTOR.sub(ITreasury(treasury).devPercent()));
    uint256 shareForDev = rayDivRes.sub(shareForTreasury)
    _mint(
      treasury,
      shareForTreasury
    );
    _mint(
      ITreasury(treasury).dev(),
      shareForDev
    );
```

to reduce operations and hence save gas.

Test Results

Test Suite Results

The test scripts corresponding to the old code suite (i.e., not `staking/*` and `venomics/*`) have not been updated, however new tests have been added for the `staking/*` and `venomics/*` directories which are out-of-scope for this engagement. We recommend updating the existing test scripts to ensure that the changed code still behaves as expected.

Appendix

File Signatures

The following are the SHA-256 hashes of the reviewed files. A file with a different SHA-256 hash has been modified, intentionally or otherwise, after the security review. You are cautioned that a different SHA-256 hash could be (but is not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of the review.

Changelog

- 2022-06-22 - Initial report
- 2022-06-27 - Revised report based on commit 9959ae2

About Quantstamp

Quantstamp is a Y Combinator-backed company that helps to secure blockchain platforms at scale using computer-aided reasoning tools, with a mission to help boost the adoption of this exponentially growing technology.

With over 1000 Google scholar citations and numerous published papers, Quantstamp's team has decades of combined experience in formal verification, static analysis, and software verification. Quantstamp has also developed a protocol to help smart contract developers and projects worldwide to perform cost-effective smart contract security scans.

To date, Quantstamp has protected $5B in digital asset risk from hackers and assisted dozens of blockchain projects globally through its white glove security assessment services. As an evangelist of the blockchain ecosystem, Quantstamp assists core infrastructure projects and leading community initiatives such as the Ethereum Community Fund to expedite the adoption of blockchain technology.

Quantstamp's collaborations with leading academic institutions such as the National University of Singapore and MIT (Massachusetts Institute of Technology) reflect our commitment to research, development, and enabling world-class blockchain security.

Timeliness of content

The content contained in the report is current as of the date appearing on the report and is subject to change without notice, unless indicated otherwise by Quantstamp; however, Quantstamp does not guarantee or warrant the accuracy, timeliness, or completeness of any report you access using the internet or other means, and assumes no obligation to update any information following publication.

Notice of confidentiality

This report, including the content, data, and underlying methodologies, are subject to the confidentiality and feedback provisions in your agreement with Quantstamp. These materials are not to be disclosed, extracted, copied, or distributed except to the extent expressly authorized by Quantstamp.

Links to other websites

You may, through hypertext or other computer links, gain access to web sites operated by persons other than Quantstamp, Inc. (Quantstamp). Such hyperlinks are provided for your reference and convenience only, and are the exclusive responsibility of such web sites' owners. You agree that Quantstamp are not responsible for the content or operation of such web sites, and that Quantstamp shall have no liability to you or any other person or entity for the use of third-party web sites. Except as described below, a hyperlink from this web site to another web site does not imply or mean that Quantstamp endorses the content on that web site or the operator or operations of that site. You are solely responsible for determining the extent to which you may use any content at any other web sites to which you link from the report. Quantstamp assumes no responsibility for the use of third-party software on the website and shall have no liability whatsoever to any person or entity for the accuracy or completeness of any outcome generated by such software.

Disclaimer

This report is based on the scope of materials and documentation provided for a limited review at the time provided. Results may not be complete nor inclusive of all vulnerabilities. The review and this report are provided on an as-is, where-is, and as-available basis. You agree that your access and/or use, including but not limited to any associated services, products, protocols, platforms, content, and materials, will be at your sole risk. Blockchain technology remains under development and is subject to unknown risks and flaws. The review does not extend to the compiler layer, or any other areas beyond the programming language, or other programming aspects that could present security risks. A report does not indicate the endorsement of any particular project or team, nor guarantee its security. No third party should rely on the reports in any way, including for the purpose of making any decisions to buy or sell a product, service or any other asset. To the fullest extent permitted by law, we disclaim all warranties, expressed or implied, in connection with this report, its content, and the related services and products and your use thereof, including, without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement. We do not warrant, endorse, guarantee, or assume responsibility for any product or service advertised or offered by a third party through the product, any open source or third-party software, code, libraries, materials, or information linked to, called by, referenced by or accessible through the report, its content, and the related services and products, any hyperlinked websites, any websites or mobile applications appearing on any advertising, and we will not be a party to or in any way be responsible for monitoring any transaction between you and any third-party providers of products or services. As with the purchase or use of a product or service through any medium or in any environment, you should use your best judgment and exercise caution where appropriate. FOR AVOIDANCE OF DOUBT, THE REPORT, ITS CONTENT, ACCESS, AND/OR USAGE THEREOF, INCLUDING ANY ASSOCIATED SERVICES OR MATERIALS, SHALL NOT BE CONSIDERED OR RELIED UPON AS ANY FORM OF FINANCIAL, INVESTMENT, TAX, LEGAL, REGULATORY, OR OTHER ADVICE.
